Vol. XXVIII

A list of catalogues of meteorite collections.

By L. J. SPENCER, C.B.E., Sc.D., F.R.S.

Formerly Keeper of Minerals in the British Museum.

[Read October 7, 1948.]

THE earliest systematic catalogue of meteorite collections is that of Otto Buchner¹ in 1863, in which he listed 264 meteorites preserved in 89 collections. Thirty years later E. A. Wülfing, after circularizing 350 mineralogical and other collections, gave preliminary results² for more than 500 meteorites with a total weight of 18,514 kilograms (18½ metric tons) preserved in 105 collections. This information was further elaborated in his valuable book³ in 1897, in which is given the weight in grams of individual meteorites in each collection.

At that time Wülfing recognized 536 known meteorites. Now there are very many more—1347 according to the latest published list (C. F. Leonard, 1946, below) and 46 others have been noticed in ‘Mineralogical Abstracts’ since 1940. Wülfing’s data, compiled for July 1893, is now, after more than half a century, much more out of date than he found Buchner’s data after an interval of thirty years. To digest all the information now available would be an enormous task. All that I have

¹ C. L. O. Buchner, Die Meteoriten in Sammlungen, ihre Geschichte, mineralogische und chemische Beschaffenheit. Leipzig, 1863, xxvi + 202 pp. Appendices 1–4 in Pogg. Ann., 1864–69, vols. 122, 124, 132, 136.

² E. A. Wülfing, Verbreitung und Wert der in Sammlungen aufbewahrten Meteoriten. Jahresh. Ver. Naturk. Württemberg, 1895, vol. 51, pp. 338–358 (preprint, 1894, pp. 1–21).

³ E. A. Wülfing, Die Meteoriten in Sammlungen und ihre Literatur, nebst einem Versuch den Tauschwert der Meteoriten zu bestimmen. Tübingen, 1897, xlvi + 461 pp. In addition to a general bibliography (pp. xxviii–xlvi) there are detailed bibliographies under each individual meteorite (pp. 1–405) and a list of the several collections (pp. 408–429).

attempted to do is to collect together the bibliographical references, leaving to some one else the task of working out all the details. I had some years ago compiled a skeleton list for my own use. Now that an International Commission on Meteorites has been set up by the International Geological Congress (eighteenth session in London, 1948) this list has been extended in the hope that it may be of general use for purposes of reference.

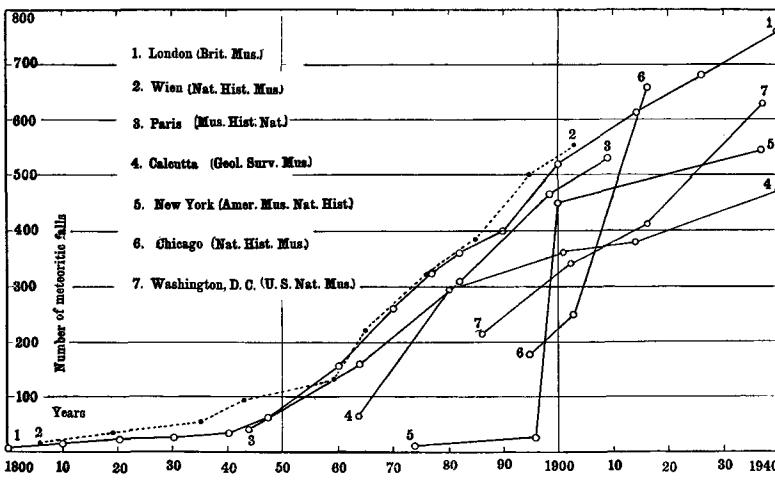

FIG. 1. Growth of meteorite collections, 1800–1940.

Formerly there were many more private collections of meteorites than at present, and Wülfing's idea of formulating exchange values was to help such collections and so stimulate the interest in and the investigation of meteorites. Many of these private collections have now been absorbed in the larger public collections, where they can be more permanently preserved, and with less danger of being lost, as has unfortunately happened with many unique specimens. Clearly this is the best plan in the case of the rarer falls and types.

The present bibliography, intended as a supplement to Wülfing, contains a few earlier references, not mentioned by him, to privately printed lists of private collections. With these and all other later lists a statement is given of the number of falls and when possible the total weight of material in each collection. Weights of individual specimens are usually stated in the catalogues but not always the total weight, and to add these up would be too laborious. The distinction often made

between 'falls' and 'finds' gives rise to some ambiguity, for 'finds' are only unobserved falls.

In addition to catalogues of collections, as at first planned, it has been thought useful to include some other relevant references later than Wülfing 1897. These include: general catalogues of meteorites; collective accounts of the meteorite falls in different countries, especially when they give information as to the depository of the material; and the all too few text-books on meteorites. For the more recent publications a reference is also added to Mineralogical Abstracts [M.A.].

The graph shows the growth of some of the more important meteorite collections from 1800 to 1940. The rocketing increase in the American collections, as compared with the European, is due to the absorption of large private collections.

ANDERSON (C.). A catalogue and bibliography of Australian meteorites, with census and taxonomy. Rec. Aust. Mus., 1913, vol. 10, no. 5, pp. 53–76. (46 falls.)

ASTAPOVICH (I. S.) Astapowitsch (I. S.) Астапович (И. С.). A list of meteorites of the Soviet Union. Journ. Roy. Astron. Soc. Canada, 1938, vol. 32, pp. 195–196. (90 falls.) [M.A. 7–172.]
