

Third supplementary list of British minerals.

By L. J. SPENCER, C.B.E., Sc.D., F.R.S.
Formerly Keeper of Minerals, British Museum.

[Read 7 November 1957.]

'MANUAL of the mineralogy of Great Britain and Ireland' by Robert Philips Greg¹ and William G. Lettsom² (London, 1858, vi+483 pp., 400 figs.) still remains the standard work of reference for British minerals, but is now much out of date and also out of print. I was able to obtain in 1895 a second-hand copy, and, with the too ambitious idea of producing a revised edition, I started collecting material, which soon became overwhelming. So in the meantime I gave in 1898 a supplementary list³ of the names of British species and varieties that had been recorded since 1858. After a period of 33 years a second supplementary list⁴ was given in 1931. Rather than wait for another 33 years, the present third list is offered on the occasion of the centenary of 'Greg and Lettsom'. In addition to these there are many references to British minerals in the International Catalogue of Scientific Literature (1901-14), and in the indexes to the Mineralogical Magazine and, since 1920, to Mineralogical Abstracts.

In these three supplementary lists about 250 species have been added to the 241 given by Greg and Lettsom in 1858, making a total of 490, as

¹ Robert Philips Greg (1826-1906), biography with portrait in Min. Mag., 1907, vol. 14, pp. 268-271. His mineral collection, which included that of Thomas Allan (1777-1833), was purchased for the British Museum in 1860, together with the 3-vol. Allan-Greg manuscript catalogue.

² William Garrow Lettsom (1805-87) was in the diplomatic service in many countries. Biographical note in Monthly Notices Roy. Astron. Soc., 1888, vol. 48, pp. 165-166. His mineral collection passed to William Nevill of Godalming and later to Charles Hampton Turner of Godstone, Surrey. These all came into the collection of Henry Ludlam, which in 1880 he bequeathed to the Museum of Practical Geology (now Geological Survey Museum). The collection of Lettsom's grandfather, John Coakley Lettsom (1744-1815), was the foundation in 1793 of the Mineralogical Museum of Harvard University.

Supplementary List of British Minerals. [1898].

By L. J. SPENCER, M.A., F.G.S.

During the forty years which have elapsed since the publication of Greg and Lettsom's 'Manual of the Mineralogy of Great Britain and Ireland' a considerable number of species, variety, and other names have been added to the list of minerals occurring in the British Isles. In 1858 Greg and Lettsom recognized 241 British species; but of these only 209 are given as numbered species by Dana in the sixth edition (1892) of his 'System of Mineralogy'. To this list may now be added 84 more, bringing the total number of British species up to 293, as compared with the total of 824 known mineral species recognized by Dana in 1892. Owing to the difficulty, in some cases, of defining a mineral species, to the uncertainty of some of the determinations, and to the fact that a systematic search through the whole of the literature has not yet been made, these numbers can only be considered approximate.

Some of the most notable additions are of minerals which have been detected by the microscopical examination of rock-sections, e.g. nephelite, nosean, and various felspars, pyroxenes, and amphiboles.

In the following list are added 113 other names which have been applied to British minerals; the species are distinguished by italics. The first observer and date have been added (in parenthesis) wherever possible; in other cases the earliest reference found is given.

By L. J. SPENCER, F.R.S.—*Second Supplementary List of
British Minerals. [1931].*

The first of these lists was presented at the Bristol meeting in 1898. They are intended to supplement the still standard work of Greg and Lettsom's 'Mineralogy of Great Britain and Ireland' (1858). The present list includes 90 names, of which 46 (printed in italics) may be regarded as well-defined species with satisfactory records. This brings the total number of mineral-species that have been found in the British Isles up to 339, representing about one-third of the number of known species.
