

Crystal Data: Hexagonal. *Point Group:* 3*m*. Very rarely as single rhombohedral crystals; commonly as parallel intergrowths with mcconnellite in tabular rhombohedral crystals, to 1 mm; in radially bladed to platy or granular aggregates.

Physical Properties: *Cleavage:* {0001}. Hardness = n.d. D(meas.) = 4.11–4.12 (synthetic). D(calc.) = [4.13]

Optical Properties: Transparent, translucent in intergrowths with mcconnellite. *Color:* Deep red to pinkish brown.

Optical Class: Uniaxial. $n = \sim 2.05$, varies in mixtures. $\omega = 2.155$ (synthetic). $\epsilon = 1.975$

Cell Data: *Space Group:* *R3m*. $a = 2.973(2)$ $c = 13.392(1)$ $Z = 3$

X-ray Powder Pattern: Merume River, Guyana.

4.47 (vvs), 2.401 (vs), 1.857 (vs), 1.486 (ms), 1.537 (mw), 2.528 (w), 1.409 (w)

Chemistry:	(1)	(2)
SiO ₂	0.42	
Al ₂ O ₃	4.3	
Fe ₂ O ₃	0.85	
Cr ₂ O ₃	77.3	89.40
CuO	5.5	
H ₂ O		10.60
LOI	11.5	
Total	99.87	100.00

(1) Merume River, Guyana; intergrowth of 80%–86% estimated grimaldiite, the balance mcconnellite and H₂O. (2) CrO(OH).

Polymorphism & Series: Trimorphous with bracewellite and guyanaite.

Occurrence: In fine-grained intergrowth with other chromium oxide-hydroxide minerals in alluvial gravels (Merume River, Guyana); in cracks and crevices in penroseite from a hydrothermal mineral deposit (Hiaco, Bolivia).

Association: Bracewellite, eskolaite, guyanaite, mcconnellite (Merume River, Guyana); penroseite, barite (Hiaco, Bolivia).

Distribution: In the basin of the Merume River, Guyana. From the Hiaco mine, 30 km north-northeast of Colquechaca, Potosí, Bolivia.

Name: For Dr. Frank Saverio Grimaldi (1915–), formerly Chief Chemist, U.S. Geological Survey.

Type Material: Harvard University, Cambridge, Massachusetts, USA; The Natural History Museum, London, England, 1979,136.
